

MEDIA = VIRUS

From the start, world-wide mainstream media all reported the same news as if they all belonged under the same umbrella and had to report in the same way

500,000 IN THE UK ALONE!

Computer code for Prof Lockdown's model which predicted 500,000 would die from Covid-19 and inspired Britain's 'Stay Home' plan is a 'mess which would get you fired in private industry' say data experts

- Professor Neil Ferguson's Imperial College London coding branded 'unreliable'
- University of Edinburgh scientists ran the same model and had different results
- Model was criticised early on by University of Oxford and public health expert
- Prof Ferguson left the government's Sage group after breaking lockdown rules

Nobody questioned the facts - they were all reported without any investigative effort

The aim seemingly was to scare and instill total fear although a bit of fact finding often showed more balanced truths

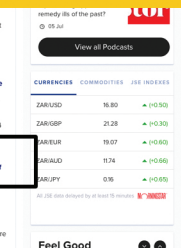

Real honest media always should question any leads or info. Covid-19 as being the most deadly disaster ever, was simply accepted as truth and fact from the beginning

You dare not question the "experts" - or the editors

A long and healthy life for all South Africans
influenza (also known as flu) kills between 6000-11,000 South Africans every year. About half of those deaths are in the elderly, and about 30 per cent in...

SO WITH 10,000 ANNUAL FLU DEATHS SA COULD EXPECT 100,000 ANNUAL COVID DEATHS

- It takes between five to twelve days to show Covid-19 symptoms during which time an individual may still be contagious. An individual may also be infectious 10 days after showing symptoms. In contrast, the seasonal flu typically takes only two days to show symptoms.
- If someone becomes infected with Covid-19, they will also likely be sick for roughly 14 days, compared to the seasonal flu's average duration of five days.
- The fatality rate for Covid-19 is 10 times that of the seasonal flu. This figure is, however, fluctuating daily as more people are infected. In some countries, daily deaths have reached rates 50% or higher than the historical average for periods of time.
- Since people require hospitalization at the same time because it is a new disease, healthcare systems may become overwhelmed and this may lead to more deaths when patients do not receive the care they require.
- While the elderly, and those with comorbidities are most at risk, some school-age children have been affected by multisystem inflammatory syndrome - a rare but severe complication of Covid-19.

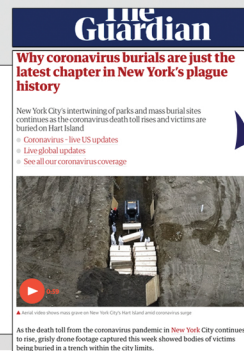

MEDIA: THE LOCKDOWN CAUSED INFECTIONS & DEATHS TO BE MUCH LOWER

WHAT ABOUT THE COUNTRIES THAT HAD NO LOCKDOWN? - THEIR INFECTIONS RATES ARE SIMILAR

"We who are adults need to be exactly that: adults. Not spread panic or rumors," Prime Minister Stefan Lofven said early on in the pandemic.

False images and reporting occurred. Trust in the media went down from an already low point

KNOWN BURIAL SITE FOR UNIDENTIFIED PERSONS

Anyone that creates or spreads fake news about the Coronavirus COVID-19 is liable for prosecution. Verify the information before you share information.

The 1,000-Bed Comfort Was Supposed to Aid New York. It Has 20 Patients.

"It's a joke," said a top hospital executive, whose facilities are packed with coronavirus patients.

SAD...

"Globally, about 3.4% of reported COVID-19 cases have died," WHO Director-General Tedros Adhanom Ghebreyesus said during a press briefing at the agency's headquarters in Geneva. In comparison, seasonal flu generally kills far fewer than 1% of those infected, he said.

Flu deaths % based on estimated cases and not on actual - shame Tedros

WHERE IT ALL STARTED...

stress, violence, misery, hunger, suicides, poor getting poorer, unemployment, uncertainty
