

MEDIA = VIRUS

Are we progressing or are we regressing? It depends how you're looking at it. We have made great advances in technology. We are healthier, live longer and have easy access to travel & communications. We know more than ever before. We have evolved laws and rules to guide us. Sounds great, but we are also the same humans with the same cranial capacity as a person who lived three thousand years ago. It shows. With trail Covid vaccines around since late-2020, we're still forced in an overly restricted world with our rights increasingly infringed upon.

QUOTE: Segregation is the adultery of an illicit intercourse between injustice and immorality - Martin Luther King Jr

Vancouver Airport, Canada

Unvaccinated Passengers
Passagers non vaccinés
未完成新冠疫苗全程接种的旅客

Fully-Vaccinated Passengers
Passagers entièrement vaccinés
已完成新冠疫苗全程接种的旅客

WAITING ROOM
FOR WHITES ONLY
BY ORDER OF
POLICE DEPT.

Similarities?
Very scary. Regressing.

Source: Australian bushfire causes (AIC file)

WHAT CAUSED IT?

- Australia typically has an annual fire season, lasting from September to March. Unfortunately, this year has been exceptionally dry, hot, and windy (prime conditions for the spread of fire). This year, Australia experienced its hottest day and driest spring on record.
- While the Australian prime minister has publicly downplayed the influence of climate change on the country's fires, other leaders are speaking up about its impact.
- Experts and emergency leaders in the country are indicating that climate change is exacerbating the fires and the conditions that make them possible.
- While 24 Australians have been arrested since November for deliberately starting fires during wildfire season, Victoria police are making it clear that arson is not the sole contributor to what's happening across the country right now.

Devastating bushfires in Australia were also caused by climate change - MSM everywhere. But is this factual and correct?

Bushfire conditions are now more dangerous than in the past, and the risk to people and property has increased. For well over 20 years, scientists have warned that climate change would increase the risk of extreme bushfires in Australia. This warning was accurate. Scientists expect extreme fire weather will continue to become more frequent and severe without substantial and rapid action to reduce greenhouse gas emissions.

https://www.climatecouncil.org.au/not-normal-climate-change-bushfire-web

... planetary vital signs indicating very troubling ... with little progress by humanity to address climate change. On the basis of these data and scientists' moral obligation to "clearly warn humanity of any catastrophic threat," they called for transformative change. Since the article's publication, more than 2,800 additional scientists have signed that declaration of a climate emergency (see supplemental file S1 for the current signatory list); in addition, 1,990 jurisdictions in 34 countries have now formally declared or recognized a climate emergency (figure 1). But, at the same time, there has been an unprecedented surge in climate-related disasters since 2019, including devastating flooding in South America and Southeast Asia, record shattering heat waves and wildfires in Australia, and the Western United States, an extraordinary Atlantic hurricane season, and devastating cyclones in Africa, South Asia, and the West Pacific (see supplemental file S2 for attribution information). There is also mounting

Smoking, burning of debris, arson, campfires, equipment use (chainsaws, grinders etc), lightning and even trains (sparks from braking) are the main contributors of Australian bushfires.
